

Problem 3

(a) The potential of an electric dipole in a material of dielectric constant ϵ is given by

$$\phi_{\text{dipole}} = \frac{P \cos \theta}{4\pi \epsilon r^2} \quad \text{if } \vec{P} \text{ points along the } z \text{ axis.}$$

For this problem with uniaxial symmetry the potential inside the sphere is

$$\phi_{\text{in}} = \frac{P \cos \theta}{4\pi \epsilon r^2} + \sum_l A_l r^l P_l(\cos \theta)$$

while outside it is

$$\phi_{\text{out}} = \sum_l B_l \frac{1}{r^{l+1}} P_l(\cos \theta)$$

The boundary conditions are:

$$(i) \quad -\frac{1}{a} \left. \frac{\partial \phi_{\text{in}}}{\partial r} \right|_{r=a} = -\frac{1}{a} \left. \frac{\partial \phi_{\text{out}}}{\partial r} \right|_{r=a} \quad (\text{tangential component of } \vec{E} \text{ is continuous})$$

$$(ii) \quad -\epsilon \left. \frac{\partial \phi_{\text{in}}}{\partial r} \right|_{r=a} = -\epsilon_0 \left. \frac{\partial \phi_{\text{out}}}{\partial r} \right|_{r=a} \quad (\text{normal component of } \vec{D} \text{ is continuous})$$

(i) gives:

$$-\frac{1}{a} \left[\frac{P}{4\pi\epsilon a^2} \underbrace{\frac{\partial(\cos\theta)}{\partial\theta}}_{P_l(\cos\theta)} + \sum_l A_l a^l \frac{\partial}{\partial\theta} P_l(\cos\theta) \right] = \\ = \sum_l B_l \frac{1}{a^{l+1}} \frac{\partial}{\partial\theta} P_l(\cos\theta)$$

or, coefficient by coefficient, the following relation between A_l and B_l :

$$l=1 \quad \frac{P}{4\pi\epsilon a^2} + A_1 a = \frac{B_1}{a^2}$$

$$l \neq 1 \quad A_l a^l = \frac{B_l}{a^{l+1}}$$

(ii) gives:

$$-\epsilon \left[\frac{P\cos\theta}{4\pi\epsilon} \left(-\frac{2}{a^3} \right) + \sum_l A_l l a^{l-1} P_l(\cos\theta) \right] = \\ = -\epsilon_0 \sum_l B_l \frac{[-(l+1)]}{a^{l+2}} P_l(\cos\theta)$$

or

$$l=1 \quad -\epsilon \left[\frac{-2P}{4\pi \epsilon a^3} + A_1 \right] = -\epsilon_0 \left(-\frac{2B_1}{a^3} \right)$$

$$l \neq 1 \quad -\epsilon A_l l a^{l-1} = -\epsilon_0 B_l \frac{[-(l+1)]}{a^{l+2}}$$

For the case $l \neq 1$ we get

$$A_l = \frac{B_l}{a^{2l+1}} \quad \text{and} \quad A_l = -B_l \frac{(l+1)}{l a^{2l+1}} \frac{\epsilon_0}{\epsilon}$$

These are the same equations as found before in the example of a dielectric sphere in a uniform electric field. The only solution is $A_l = B_l = 0$ ($l \neq 1$).

For $l=1$ we find 2 nontrivial results. The equations are:

$$\frac{P}{4\pi \epsilon a^2} + A_1 a = \frac{B_1}{a^2} \quad \text{and} \quad \frac{2P}{4\pi a^3} - \epsilon A_1 = \frac{2B_1 \epsilon_0}{a^3}$$

↓ multiplying by $-\frac{\epsilon}{a}$:

$$-\frac{P}{4\pi a^3} - \epsilon A_1 = -\frac{\epsilon B_1}{a^3} \quad \text{. Then:}$$

$$\frac{2P}{4\pi a^3} - 2 \frac{B_1 \epsilon_0}{a^3} = -\frac{P}{4\pi a^3} + \frac{\epsilon B_1}{a^3} \quad \text{or}$$

$$\frac{3P}{4\pi a^3} = (\epsilon + 2\epsilon_0) \frac{B_1}{a^3}$$

$$B_1 = \frac{3P}{4\pi(\epsilon + 2\epsilon_0)}$$

$$A_1 = \frac{B_1}{a^3} - \frac{P}{4\pi\epsilon a^3} = \frac{3P}{4\pi a^3 (\epsilon + 2\epsilon_0)} - \frac{P}{4\pi\epsilon a^3} =$$

$$= \frac{P}{4\pi a^3} \left(\frac{3}{\epsilon + 2\epsilon_0} - \frac{1}{\epsilon} \right) = \frac{P}{4\pi a^3} \frac{[3\epsilon - (\epsilon + 2\epsilon_0)]}{\epsilon(\epsilon + 2\epsilon_0)} =$$

$$= \frac{P}{4\pi a^3} \frac{2(\epsilon - \epsilon_0)}{\epsilon(\epsilon + 2\epsilon_0)}$$

Then the potential outside is

$$\left[\phi_{\text{out}} = \frac{B_1}{r^2} P_1(\cos\theta) = \frac{3P}{4\pi(\epsilon + 2\epsilon_0)} \frac{1}{r^2} \cos\theta \right] (r > a)$$

and inside

$$\left[\begin{aligned} \phi_{\text{in}} &= \frac{P \cos\theta}{4\pi\epsilon r^2} + \frac{P}{4\pi a^3} \frac{2(\epsilon - \epsilon_0)}{\epsilon(\epsilon + 2\epsilon_0)} r \cos\theta \\ &= \frac{P \cos\theta}{4\pi\epsilon r^2} \left[1 + 2 \frac{r^3}{a^3} \left(\frac{\epsilon - \epsilon_0}{\epsilon + 2\epsilon_0} \right) \right] \end{aligned} \right] (r \leq a)$$
